

## D2BS STRENGTH PROFILE CHART\*

Different bodies need different training protocols. So, I created this chart comparing 4 strength profiles and their programming variables to help you dial in your workouts. *Note: If you don't recognize yourself in one of the categories, it could be that you have a balanced profile and/or have traits from some or all 4.*

Component	Novelty Seeker (NS)	Harm Avoidance (HA)	Reward Dependent (RD)	Energetic Sensitive (ES)
<b>Motivation</b>	<p><b>Wants to be stimulated and challenged in innovative ways</b></p> <p><i>Needs challenging routines with a high level of variety, otherwise, gets bored</i></p>	<p><b>Wants to avoid getting injured or stressed</b></p> <p><i>Needs planned workouts and time to become comfortable with new methods to avoid being stressed out or feeling unsafe</i></p>	<p><b>Wants to be skilled and be respected/admired by others</b></p> <p><i>Needs to have a goal backed up with skill, speed or endurance dominant programming</i></p>	<p><b>Wants to exercise but has mechanical limitations (e.g., flexibility, coordination, etc.)</b></p> <p><i>Needs to ease muscles into activity to minimize discomfort or pain</i></p>
<b>Variation</b>	<p><b>HIGH</b></p> <p>Needs lots of changes in training strategies, methods, volume, intensity, weight, tempo and stimuli</p> <p>Needs change every 2 weeks</p>	<p><b>MINIMAL</b></p> <p>Needs stable training plan. To avoid accommodation, use least impactful changes (aka change rest interval, rep tempo and rep scheme)</p> <p>Needs change every 8 weeks</p>	<p><b>MEDIUM</b></p> <p>Needs changes in volume, weight, tempo and methods</p> <p>Needs change every 4 weeks</p>	<p><b>MINIMAL</b></p> <p>Changes in isometric pauses are best, <u>NOT</u> in exercises</p> <p>Responds well to reps done with VERY SLOW tempo</p> <p>Needs change every 12 weeks</p>
<b>Frequency</b>	<b>5-6x A WEEK</b>	<b>4-5x A WEEK; 5 IS MAX</b>	<b>5-6x A WEEK</b>	<b>3-4X A WEEK</b>
<b>Intensity Week (# /Type of Workouts)</b>	<p><b>1 HARD STRESS (8-9)</b></p> <p><b>2-3 MODERATE STRESS (7)</b></p> <p><b>2 RESTORATIVE STRESS (5-6)</b></p>	<b>MODERATE STRESS (7)</b>	<p><b>2 HARD STRESS (8-9)</b></p> <p><b>2-3 MODERATE STRESS (7)</b></p> <p><b>1-2 RESTORATIVE STRESS (5-6)</b></p>	<b>MODERATE STRESS (7)</b>
<b>Volume</b>	<p><b>MEDIUM-HIGH VOLUME</b></p> <p>Duration: 60-90 minutes; 5-7 methods; 15-18 work sets</p>	<p><b>MEDIUM VOLUME</b></p> <p>Duration: 45-60 minutes 5-6 methods; 9-12 work sets</p>	<p><b>HIGH VOLUME</b></p> <p>Duration: 75-90 minutes 7+ methods; 20-25 work sets</p>	<p><b>LOW VOLUME</b></p> <p>Duration: 30-45 minutes 5 methods; 9-12 work sets</p>
<b>Training Preparation</b>	<p>Needs CNS/muscle activation exercises to 'wake up'</p> <p>CNS → muscles</p>	<p>Needs muscle warm-up (e.g., Phases 1-3 of Rusin Dynamic Warm-up) to minimize injury</p>	<p>Needs CNS/muscle activation exercises to 'wake up'</p> <p>CNS → muscles and targeted mobility work to perform well</p>	<p>Needs longer muscle warm-up (e.g., Rusin Phases 1-6 of Dynamic Warm-up) to minimize pain</p>
<b>Progression</b>	<p>Does better with double progression model and drastic phase changes</p>	<p>Does better with single progression model and VERY SLOW addition of weight/volume over time</p>	<p>Does better with single progression model for big lifts; fatigue-based model for hypertrophy work</p>	<p>Needs VERY SLOW addition of weight/volume over time; Needs simple variations toward unstable movements</p>

Component	Novelty Seeker (NS)	Harm Avoidance (HA)	Reward Dependent (RD)	Energetic Sensitive (ES)
<b>De-loading</b>	<b>LESS WEIGHT OR LESS VOLUME</b> (Not Needed if Changing Program Every 2 Weeks)	<b>SAME WEIGHT, LESS VOLUME</b>	<b>SAME LIFTS BUT REPLACE ASSISTANCE WORK WITH NEURAL CHARGE WORKOUTS</b>	<b>DON'T WORK HARD ENOUGH TO REQUIRE DELOADING</b>
<b>Peaking</b>	Take 1 day off 2 days before competition with light workouts (60-65% of effort) during week and day before	Follow taper model with last hard session 5-7 days prior to competition, with other days at around 65-70% with 2 days off	Follow taper model. May need anxiety management to avoid choking and/or coach positive reinforcement	Not usually competitive types or need to plan for peaking
<b>High Intensity Interval Training (HIIT)</b>	<b>YES</b> Best if done at end of workout and gauged to remaining work capacity to avoid overdoing it	<b>YES</b> Best if done in session separate from strength session	<b>YES</b> Can be done anytime	<b>YES</b> ONLY use methods w/simple, stable movement patterns (aka no plyometrics, complex skills)
<b>Steady State Low Intensity Cardio (SSLI)</b>	<b>YES</b> Include ONLY as restorative workout; not on lifting days. Don't like more than 2x a week due to boredom factor	<b>YES</b> Can be on lifting days but better if not in the same workout	<b>YES</b> Best if done on non-lifting days to avoid excess cortisol production	<b>YES</b>
<b>Pitfalls</b>	Too much volume, training ADHD, poor re-feeding timing and/or don't allow enough time for recovery	Restrictive diet (under-eat), don't push 'hard' enough to get results, training OCD (analysis paralysis)	Can hold back or push too hard in front of others, stimulus addict, prone to feeling stress from a bad workout	Enhanced response to pain causing them to stop early; hypertonicity of muscles...especially in flexors

\* Based on the neurotransmitter profiling work of Charles Poliquin and Christian Thibaudeau
